

Chapter 7 - Methods in Java

Sometimes our program grows in size and we want to separate the logic of main method to other methods

For instance - If we are calculating average of a number 5 times, we can use methods to avoid repeating the logic.

→ DRY = Don't Repeat Yourself

Syntax of a Method

A method is a function written inside a class. Since Java is an Object Oriented language, we need to write the method inside some class

```
dataType name () {  
    // Method body  
}
```

Following method returns sum of two numbers

→ Return type

```
int mySum(int a, int b) {  
    int c = a + b;  
    return c;  
}
```

→ Return value

Calling a Method

A method can be called by creating an object of the class in which the method exists followed by the method call:

```
Calc obj = new Calc(); → Object Creation  
obj.mySum(a, b); → Method call upon an object
```

The values from the method call (a and b) are copied to the a and b of the function *mySum*. Thus even if we modify the values a and b inside the method, the values in the main method will not change.

Void return type

When we don't want our method to return anything, we use void as the return type.

Static keyword

Static keyword is used to associate a method of a given class with the class rather than the object. Static method in a class is shared by all the objects.

Process of method invocation in Java

Consider the method Sum:

```
int Sum (int a, int b)
{
    return a+b;
}
```

The method is called like this:

```
Calc obj = new Calc();
c = obj.Sum(2, 3)
```

The values 2 and 3 are copied to a and b and then $a+b = 2+3 = 5$ is returned in c which is an integer.

Note: In case of Arrays, the reference is passed. Same is the case for object passing to methods.

Method Overloading

Two or more methods can have same name but different parameters. Such methods are called Overloaded methods.

```
Void foo()
```

```
Void foo(int a)
```

```
int foo(int a, int b)
```

⇒ Overloaded function foo

Method overloading cannot be performed by changing the return type of methods

Variable Arguments (Varargs)

A function with vararg can be created in Java using the following syntax:

```
public static void foo(int ... arr)
{
```

```
// arr is available here as int[] arr
```

```
}
```

foo can be called with Zero or more arguments like this:

```
foo(7)  foo(7, 8, 9)  foo(1, 2, 7, 8, 9)
```

We can also create a function bar like this

```
public static void bar(int a, int arr)
{
```

```
// Code
```

```
}
```

↳ Atleast one integer is required now

bar can be called as bar(1), bar(1, 2), bar(1, 7, 9, 11) etc.

Recursion

A function in Java can call itself. Such calling of function by itself is called recursion.

Example: Factorial of a number

$$\text{factorial}(n) = n * \text{factorial}(n-1) \quad \forall n \geq 1$$

Quick Quiz: Write a program to calculate (recursion must be used) factorial of a number in Java?
